INTRODUCING

A New Keyboard for Windows Accessibility

Logickeyboards new keyboard developed for Windows Accessibility*
-selected accessibility functions placed directly on the F-row

*Windows Accessibility is a set of functions in Microsoft Windows that includes features such as magnifier, contrast settings and voice functions.

Windows Accessibility functions

Instead of searching through settings or remembering key combinations, commonly used functions are placed directly on the F-row.

The Windows Accessibility keyboard is designed for users who benefit from quicker access to selected Windows Accessibility functions.

Magnifier settings

Open Magnifier settings, turn Magnifier on/off and access zoom controls.

Zoom views

Choose between Full Screen Zoom, Lens Zoom and Docked View and zoom in/out.

Reading and voice tools

Access Magnifier Reader and Voice Typing from the keyboard.

Contrast tools

Invert colors or activate high contrast mode in Windows and apps.

Fn Lock for easier access

Get direct access to the function keys without pressing Fn at the same time.

A keyboard built around accessibility

Brings selected Windows accessibility tools closer to you.

Designed for Windows Accessibility

This Logickeyboard is designed for enhanced accessibility and therefore combines its Windows Accessibility keys with Large Print bold letters and high contrast color combinations for improved readability.

Fn / Fn

To use the Windows Accessibility functions:
Hold the Fn key while pressing F1–F12, or activate the Fn Lock to use the function without holding the Fn key.

The Windows Accessibility functions help users adjust zoom, increase contrast, invert colors and access reading and voice tools directly from the F-row on the keyboard.
